Soft Computing Applications

3 > 4 3

• Defuzzification means the fuzzy to crisp conversion.

• Example 1:

Suppose, T_{HIGH} denotes a fuzzy set representing **temperature is** High.

 T_{HIGH} is given as follows.

 $T_{HIGH} = (15,0.1), (20, 0.4), (25,0.45), (30,0.55), (35,0.65), (40,0.7), (45,0.85), (50,0.9)$

• What is the crisp value that implies for the high temperature?

As an another example, let us consider a fuzzy set whose membership finction is shown in the following figure.

What is the crisp value of the fuzzy set in this case?

Example 3: Fuzzy to crisp

Now, consider the following two rules in the fuzzy rule base.

R1: If x is A then y is C

R2: If x is B then y is D

A pictorial representation of the above rule base is shown in the following figures.

What is the crisp value that can be inferred from the above rules given an input say x'?

Debasis Samanta (IIT Kharagpur)

The fuzzy results generated can not be used in an application, where decision has to be taken only on crisp values.

Example:

If T_{HIGH} then rotate R_{FIRST} .

Here, may be input T_{HIGH} is fuzzy, but action **rotate** should be based on the crisp value of R_{FIRST} .

Following figures shows a general fraework of a fuzzy system.

Defuzzification Techniques

Debasis Samanta (IIT Kharagpur)

Soft Computing Applications

09.02.2018 7 / 55

4 A N

A number of defuzzification methods are known. Such as

- Lambda-cut method
- Weighted average method
- Maxima methods
- Centroid methods

Lambda-cut method

Lmabda-cut method is applicable to derive crisp value of a fuzzy set or relation. Thus

- Lambda-cut method for fuzzy set
- Lambda-cut method for fuzzy relation

In many literature, Lambda-cut method is also alternatively termed as *Alph-cut method*.

- In this method a fuzzy set A is transformed into a crisp set A_λ for a given value of λ (0 ≤ λ ≤ 1)
- 2 In other-words, $A_{\lambda} = \{x | \mu_A(x) \ge \lambda\}$
- That is, the value of Lambda-cut set A_λ is x, when the membership value corresponding to x is greater than or equal to the specified λ.
- This Lambda-cut set A_{λ} is also called alpha-cut set.

$$egin{aligned} &\mathcal{A}_1=\{(x_1,0.9),(x_2,0.5),(x_3,0.2),(x_4,0.3)\} \ & ext{Then} \ &\mathcal{A}_{0.6}=\{(x_1,1),(x_2,0),(x_3,0),(x_4,0)\}=\{x_1\} \ & ext{and} \end{aligned}$$

$$A_2 = \{(x_1, 0.1), (x_2, 0.5), (x_3, 0.8), (x_4, 0.7)\}$$

$$A_{0,2} = \{(x_1,0), (x_2,1), (x_3,1), (x_4,1)\} = \{x_2, x_3, x_4\}$$

・ロト ・ 日 ト ・ ヨ ト ・

Two fuzzy sets P and Q are defined on x as follows.

$\mu(\mathbf{x})$	<i>x</i> ₁	<i>x</i> ₂	<i>X</i> 3	<i>x</i> ₄	<i>x</i> 5
P	0.1	0.2	0.7	0.5	0.4
Q	0.9	0.6	0.3	0.2	0.8

Find the following :

(a) $P_{0.2}, Q_{0.3}$

(b) $(P \cup Q)_{0.6}$

(c) $(P \cup \overline{P})_{0.8}$

(d) $(P \cap Q)_{0.4}$

A (10) A (10)

The Lambda-cut method for a fuzzy set can also be extended to fuzzy relation also.

Example: For a fuzzy relation R

$$R = \begin{bmatrix} 1 & 0.2 & 0.3 \\ 0.5 & 0.9 & 0.6 \\ 0.4 & 0.8 & 0.7 \end{bmatrix}$$

We are to find λ -cut relations for the following values of $\lambda = 0, 0.2, 0.9, 0.5$ $R_0 = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$ and $R_{0.2} = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$ and $R_{0.9} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{bmatrix}$ and $R_{0.5} = \begin{bmatrix} 1 & 0 & 0 \\ 1 & 1 & 1 \\ 0 & 1 & 1 \end{bmatrix}$ If *A* and *B* are two fuzzy sets, defined with the same universe of discourse, then

$$(A \cup B)_{\lambda} = A_{\lambda} \cup B_{\lambda}$$

- $(A \cap B)_{\lambda} = A_{\lambda} \cap B_{\lambda}$
- (\overline{A})_{λ} \neq \overline{A} _{λ} except for value of λ = 0.5
- So For any $\lambda \leq \alpha$, where α varies between 0 and 1, it is true that $A_{\alpha} \subseteq A_{\lambda}$, where the value of A_0 will be the universe of discourse.

If *R* and *S* are two fuzzy relations, defined with the same fuzzy sets over the same universe of discourses, then

- $(\mathbf{R} \cup \mathbf{S})_{\lambda} = \mathbf{R}_{\lambda} \cup \mathbf{S}_{\lambda}$
- $(R \cap S)_{\lambda} = R_{\lambda} \cap S_{\lambda}$
- $\bigcirc \ \, (\overline{R})_{\lambda} \neq \overline{R}_{\lambda}$
- **(**) For $\lambda \leq \alpha$, where α between 0 and 1, then $R_{\alpha} \subseteq R_{\lambda}$

Lambda-cut method converts a fuzzy set (or a fuzzy relation) into crisp set (or relation).

- **→ →** •

Output of a Fuzzy System

Debasis Samanta (IIT Kharagpur)

Soft Computing Applications

09.02.2018 18 / 55

The output of a fuzzy system can be a single fuzzy set or union of two or more fuzzy sets.

To understand the second concept, let us consider a fuzzy system with *n*-rules.

 R_1 : If x is A_1 then y is B_1 R_2 : If x is A_2 then y is B_2

 R_n : If x is A_n then y is B_n

In this case, the output *y* for a given input $x = x_1$ is possibly $B = B_1 \cup B_2 \cup \dots B_n$

Output fuzzy set : Illustration

Suppose, two rules R_1 and R_2 are given as follows:

- R_1 : If x is A_1 then y is C_1
- 2 R_2 : If x is A_2 then y is C_2

Here, the output fuzzy set $C = C_1 \cup C_2$.

For instance, let us consider the following:

Debasis Samanta (IIT Kharagpur)

The fuzzy output for $x = x_1$ is shown below.

Fuzzy output for $x = x_1$

The fuzzy output for $x = x_2$ is shown below.

09.02.2018 22 / 55

Output fuzzy set : Illustration

The fuzzy output for $x = x_3$ is shown below.

09.02.2018 23 / 55

Following defuzzification methods are known to calculate crisp output in the situations as discussed in the last few slides

Maxima Methods

- Height method
- Pirst of maxima (FoM)
- Last of maxima (LoM)
- Mean of maxima(MoM)

Centroid methods

- Center of gravity method (CoG)
- 2 Center of sum method (CoS)
- Center of area method (CoA)

Weighted average method

Maxima methods

Following defuzzification methods are known to calculate crisp output.

Maxima Methods

- Height method
- Pirst of maxima (FoM)
- Last of maxima (LoM)
- Mean of maxima(MoM)

Centroid methods

- Center of gravity method (CoG)
- Center of sum method (CoS)
- Ocenter of area method (CoA)

Weighted average method

Maxima method : Height method

This method is based on Max-membership principle, and defined as follows.

$$\mu_{\mathcal{C}}(x^*) \geq \mu_{\mathcal{C}}(x)$$
 for all $x \in X$

Note:

- 1. Here, x^* is the height of the output fuzzy set *C*.
- 2. This method is applicable when height is unique.

Debasis Samanta (IIT Kharagpur)

Soft Computing Applications

FoM: First of Maxima : $x^* = min\{x | C(x) = max_w C\{w\}\}$

LoM : Last of Maxima : $x^* = max\{x|C(x) = max_wC\{w\}\}$

- E - N

$$\mathbf{X}^* = \frac{\sum_{\mathbf{x}_i \in \mathbf{M}}(\mathbf{x}_i)}{|\mathbf{M}|}$$

where, $M = \{x_i | \mu(x_i) = h(C)\}$ where h(C) is the height of the fuzzy set *C*

• • • • • • • • • • • •

Suppose, a fuzzy set Young is defined as follows:

Young = {(15,0.5), (20,0.8), (25,0.8), (30,0.5), (35,0.3) }

Then the crisp value of **Young** using MoM method is $x^* = \frac{20+25}{2} = 22.5$

Thus, a person of 22.5 years old is treated as young!

Defuzzification Technique Centroid Methods

Debasis Samanta (IIT Kharagpur)

Soft Computing Applications

09.02.2018 33 / 55

Cenroid methods

Following defuzzification methods are known to calculate crisp output.

• Maxima Methods

- Height method
- Pirst of maxima (FoM)
- Last of maxima (LoM)
- Mean of maxima(MoM)

Centroid methods

- Center of gravity method (CoG)
- 2 Center of sum method (CoS)
- Center of area method (CoA)

Weighted average method

Centroid method : CoG

- The basic principle in CoG method is to find the point x* where a vertical line would slice the aggregate into two equal masses.
- Mathematically, the CoG can be expressed as follows :

$$\mathbf{X}^* = \frac{\int x \cdot \mu_C(x) dx}{\int \mu_C(x) dx}$$

Graphically,

Note:

- x^* is the x-coordinate of center of gravity.
- $\int \mu_C(x) dx$ denotes the area of the region bounded by the curve μ_C .
- If μ_C is defined with a discrete membership function, then CoG can be stated as :

$$X^* = rac{\sum_{i=1}^{n} x_i . \mu_C(x_i)}{\sum_{i=1}^{n} \mu_C(x_i)}$$
;

Here, x_i is a sample element and n represents the number of samples in fuzzy set C.

イロト イポト イヨト イヨト

CoG : A geometrical method of calculation

Steps:

 Divide the entire region into a number of small regular regions (e.g. triangles, trapizoid etc.)

2 Let A_i and x_i denotes the area and c.g. of the *i*-th portion.

Then x* according to CoG is

$$\mathbf{X}^* = \frac{\sum_{i=1}^n x_i \cdot (\mathbf{A}_i)}{\sum_{i=1}^n \mathbf{A}_i}$$

where *n* is the number of smaller geometrical components.

Debasis Samanta (IIT Kharagpur)

CoG: An example of integral method of calculation

Debasis Samanta (IIT Kharagpur)

Soft Computing Applications

09.02.2018 38 / 55

CoG: An example of integral method of calculation

$$\mu_c(x) = \begin{cases} 0.35x & 0 \le x < 2\\ 0.7 & 2 \le x < 2.7\\ x - 2 & 2.7 \le x < 3\\ 1 & 3 \le x < 4\\ (-0.5x + 3) & 4 \le x \le 6 \end{cases}$$

For $A_1 : y - 0 = \frac{0.7}{2}(x - 0)$, or y = 0.35xFor $A_2 : y = 0.7$ For $A_3 : y - 0 = \frac{1 - 0}{3 - 2}(x - 2)$, or y = x - 2For, $A_4 : y = 1$ For, $A_5 : y - 1 = \frac{0 - 1}{6 - 4}(x - 4)$, or y = -0.5x + 3

CoG: An example of integral method of calculation

Thus,
$$x^* = \frac{\int x \cdot \mu_c(x) dx}{\int \mu_c(x) dx} = \frac{N}{D}$$

$$N = \int_0^2 0.35x^2 dx + \int_2^{2.7} 0.7x^2 dx + \int_{2.7}^3 (x^2 - 2x) dx + \int_3^4 x dx + \int_4^6 (-0.5x^2 + 3x) dx$$

= 10.98

$$D = \int_0^2 0.35x dx + \int_2^{2.7} 0.7x dx + \int_{2.7}^3 (x-2) dx + \int_3^4 dx + \int_4^6 (-0.5x+3) dx$$

= 3.445

Thus,
$$x^* = \frac{10.98}{3.445} = 3.187$$

• • • • • • • • • • • •

Centroid method : CoS

If the output fuzzy set $C = C_1 \cup C_2 \cup ..., C_n$, then the crisp value according to CoS is defined as

$$\mathbf{x}^* = \frac{\sum_{i=1}^n x_i . A_{c_i}}{\sum_{i=1}^n A_{c_i}}$$

Here, A_{c_i} denotes the area of the region bounded by the fuzzy set C_i and x_i is the geometric center of the area A_{c_i} .

Graphically,

Debasis Samanta (IIT Kharagpur)

Soft Computing Applications

09.02.2018 41 / 55

Note:

- In CoG method, the overlapping area is counted once, whereas, in CoS, the overlapping is counted twice or so.
- In CoS, we use the center of area and hence, its name instead of center of gravity as in CoG.

Consider the three output fuzzy sets as shown in the following plots:

CoS: Example

In this case, we have

$$A_{c_1} = \frac{1}{2} \times 0.3 \times (3+5), x_1 = 2.5$$

$$A_{c_2} = \frac{1}{2} \times 0.5 \times (4+2), x_2 = 5$$

$$A_{c_3} = \frac{1}{2} \times 1 \times (3+1), x_3 = 6.5$$
Thus, $x^* = \frac{\frac{1}{2} \times 0.3 \times (3+5) \times 2.5 + \frac{1}{2} \times 0.5 \times (4+2) \times 5 + \frac{1}{2} \times 1 \times (3+1) \times 6.5}{\frac{1}{2} \times 0.3 \times (3+5+\frac{1}{2} \times 0.5 \times (4+2) + \frac{1}{2} \times 1 \times (3+1)} = 5.00$

Note:

The crisp value of $C = C_1 \cup C_2 \cup C_3$ using CoG method can be found to be calculated as $x^* = 4.9$

Debasis Samanta (IIT Kharagpur)

Soft Computing Applications

Centroid method: Certer of largest area

If the fuzzy set has two subregions, then the center of gravity of the subregion with the largest area can be used to calculate the defuzzified value.

Mathematically,
$$x^* = \frac{\int \mu_{c_m}(x) \cdot x' \, dx}{\int \mu_{c_m}(x) \, dx};$$

Here, C_m is the region with largest area, x' is the center of gravity of C_m .

Graphically,

Cenroid methods

Following defuzzification methods are known to calculate crisp output.

• Maxima Methods

- Height method
- Pirst of maxima (FoM)
- Last of maxima (LoM)
- Mean of maxima(MoM)

Centroid methods

- Center of gravity method (CoG)
- Center of sum method (CoS)
- Ocenter of area method (CoA)

Weighted average method

- This method is also alternatively called "Sugeno defuzzification" method.
- The method can be used only for symmetrical output membership functions.
- The crisp value accroding to this method is

$$X^* = \frac{\sum_{i=1}^{n} \mu_{C_i}(x_i).(x_i)}{\sum_{i=1}^{n} \mu_{C_i}(x_i)}$$

where, C_1 , C_2 , ... C_n are the output fuzzy sets and (x_i) is the value where middle of the fuzzy set C_i is observed.

.

Graphically,

Find the crisp value of the following using all defuzzified methods.

4 A N

-

Find the crisp value of the following using all defuzzified methods.

Exercise 3

 The membership function defining a student as Average, Good, and Excellent denoted by respective membership functions are as shown below.

- Find the crisp value of "Good Student"
- Hint: Use CoG method to the portion "Good" to calculate it.

- The width of a road as narrow and wide is defined by two fuzzy sets, whose membership functions are plotted as shown above.
- If a road with its degree of membership value is 0.4 then what will be its width (in crisp) measure.
- Hint: Use CoG method for the shadded region.

Exercise 5

 The faulty measure of a circuit is defined fuzzily by three fuzzy sets namely Faulty(F), Fault tolerant (FT) and Robust(R) defined by three membership functions with number of faults occur as universe of discourses and is shown below.

- Reliability is measured as $R^* = F \cup FT \cup R$. With a certain observation in testing $(x, 0.3) \in R, (x, 0.5) \in FT, (x, 0.8) \in F$.
- Calculate the reliability measure in crisp value.
